

FALLS

Falls can happen for many reasons. It is not normal to fall. If someone is falling a lot (as often as once a week), the reason for the falls needs to be determined.

Some of the reasons that someone might fall are:

- **Seizures** – a fall can occur during the seizure or right after the seizure when a person is not yet fully recovered.
- **Body deformities** – curvature of the spine, one leg shorter than the other leg, clubfoot, tight heel cord, or a poorly healed fracture.
- **Balance problems** – due to a medical condition like cerebral palsy, tremors, or a stroke.
- **Medications** – many medications and or a change in a dose of a medication can affect a person's balance.
- **Change in vision** – new glasses, broken glasses, eye infections, ear infections, and headaches.
- **Foot problems** – sore toes, new shoes, poorly fitting shoes or braces.
- **Clothing** – loose or baggy clothing, untied shoes, pants that are too long, slippery soles of shoes or shoes that catch on carpet.
- **Walking surfaces** – uneven, wet, or slippery, bad lighting, walking too fast, or blocked pathways.
- **Tiredness or illness** – can cause a person to have a decrease in their energy level.
- **Increase in energy** – can cause a person to move too quickly or be distracted easily.
- **Injury** – can cause a person to change how they walk in order to protect the injury.

IF SOMEONE FALLS, WHAT SHOULD YOU DO?

Call 911 if the person:

- Is in a lot of pain while lying still or when they move
- Has an obvious deformity (bone sticking out, swelling or unusual position of arm or leg or head)
- Is unconsciousness
- Gray in color

Anytime someone falls, whether they appear to be hurt or not, they need to be thoroughly examined for any possible injury. ***Do not move them until it has been determined that a serious injury has not occurred.***

The fall and all that you see after the fall needs to be written down and reported to other staff members. Often the injury will not be obvious right away, like bruising, but if the fall has been reported with details about how the person landed, bruises that show up later can be explained.

Look for:

- Redness
- Scrapes or abrasions like "rug burns"
- Cuts or bleeding
- Swelling
- Any complaint of pain and where that pain is and when they complain. For example, "Joe complains of pain in his right knee when he kneels on it."

Once you have taken care of the person who fell and written the report of the incident, you may also need to:

- Tell your supervisor or the nurse about the fall.
- Fix whatever caused the fall, if you can.
- Write down and give to your supervisor and other staff a list of unsafe conditions that are still present (like a slippery sidewalk, wet floor, or broken equipment).
- Think about what would prevent more falls and talk about it with your supervisor and other staff.
